Executive Summary

1 High-Level Overview

OVERVIEW		
Total APIs Tested	0 APIs	
Base URL		
Pass / Fail / Blocked	Backend (endpoint): 0 Passed / 0 Failed Frontend: 9 Passed / 1 Failed / 1 Blocked	

2 Key Findings

Test Summary

The frontend suite looks strong overall: 9 tests passed, 1 test was blocked, and 1 test failed. Scoring is based on the executable subset only, so the blocked mobile-navigation test is excluded from the quality score. Core patient-facing flows like specialty pages, emergency CTAs, About/Facilities pages, and homepage sections are functioning as expected, which suggests the main content and navigation are stable. The main reliability concern is SEO discovery: the homepage did not expose canonical, meta, Open Graph, or JSON-LD data during the crawl, which can hurt search visibility and link previews even though the visible UI is working.

What could be better

The biggest gap is the homepage head metadata. The SEO test reported that `rel="canonical"`, meta description/keywords/robots, Open Graph tags, and JSON-LD for the MedicalBusiness phone number were not found on the crawled homepage. That points to either missing server-rendered metadata, client-only injection, or a stale cached HTML response. The mobile navigation test was blocked by the harness because the page only rendered desktop layout in this environment, so responsive behavior still needs confirmation in a true mobile viewport. Aside from that, the functional user flows passed, so the main weaknesses are discoverability and responsive assurance rather than core content bugs.

Recommendations

Fix the homepage `` first: ensure canonical URL, meta description, robots, Open Graph tags, and JSON-LD are present in the initial server-rendered HTML for `https://sanadihospital.in/`, not added only after client hydration. Then verify caching/CDN is not serving an outdated shell. After that, test the responsive header in a real mobile viewport and confirm the hamburger menu appears below the desktop breakpoint. Re-run the exact failing checks after each change, especially the `SEO Discovery and Meta Tag Verification` and `Mobile Navigation and Responsive Layout` tests, to confirm the fixes are visible to crawlers and mobile users.

Frontend UI Test Results

1 Test Coverage Summary

This report summarizes the frontend UI testing results for the application. TestSprite's AI agent automatically generated and executed tests based on the UI structure, user interaction flows, and visual components. The tests aimed to validate core functionalities, visual correctness, and responsiveness across different states.

URL NAME	TEST CASES	PASS/FAIL RATE
SanadiHospital-frontend	11	9 Pass / 1 Fail / 1 Blocked

Note

The test cases were generated using real-time analysis of the application's UI hierarchy and user flows. Some visual and functional validations were adapted dynamically based on runtime DOM changes.

2 Test Execution Summary

SanadiHospital-Frontend Execution Summary

TEST CASE	TEST DESCRIPTION	IMPACT	STATUS
Mobile Navigation and Responsive Layout	Verify responsive header, mobile menu toggle, drawer navigation, and specialty sub-links	p1	Blocked
General Orthopaedics and Fracture Management	Verify General Orthopaedics specialty page, fracture care, bone health, and deformity correction information	p1	Passed
Navigation Bar and Specialties Dropdown Menu	Verify navigation bar links, Specialties dropdown menu options, and page routing across clinical departments	p1	Passed
Sports Injury Clinic and Athletic Medicine	Verify Sports Injury Clinic page, athletic medicine procedures, PRP therapies, and return-to-play programs	p1	Passed
Emergency Contacts and Booking CTAs	Verify telephone links, emergency hotline 083532 98899, WhatsApp chat triggers, and booking callouts	p0	Passed
SEO Discovery and Meta Tag Verification	Verify canonical links, structured schema data, Open Graph previews, and robots discovery on homepage	p0	Failed
About Us and Hospital Facilities Pages	Verify About Us founder timeline and Facilities infrastructure pages load properly	p1	Passed
Homepage Navigation and Core Sections	Verify homepage hero, brand emblem, specialty navigation links, and call-to-action buttons load correctly	p0	Passed
Physiotherapy and Rehabilitation Specialty	Verify Physiotherapy and Rehabilitation department page, modalities, and post-surgery recovery details	p1	Passed
Neurosurgery and Spine Care Specialty	Verify Neurosurgery and Spine Care department page, clinical overview, and treatment options	p1	Passed
Specialties Pages and Emergency Trauma Care	Verify specialty department pages including Arthroscopy, Joint Replacement, and 24/7 Trauma Care load with correct details	p1	Passed

Error

TEST BLOCKED The test could not be run — the site loaded in a desktop layout and the environment does not provide a way to switch the browser to a mobile viewport for this session. Observations: - The page loaded in desktop layout and the header shows full navigation links (Home, Specialties, Facilities, About Us, Book now). - No mobile hamburger menu is visible in the header in the current rendering. - No supported action was available in this environment to change the viewport or user-agent to emulate a mobile device, so the mobile-only UI could not be reached.

71     asyncio.run(run_test())
72

```

Error

TEST FAILURE Required head metadata and JSON-LD were not found on the homepage during this session.

Observations: - The page does not expose a link rel="canonical" pointing to https://sanadihospital.in/ (canonical not found). - Meta description, meta keywords, meta robots, and Open Graph tags (og:title, og:image) were not found in the extractable page head. - No application/ld+json JSON-LD content containing the MedicalBusiness phone number +91-8353298899 was found (no JSON-LD script with that phone string was retrieved).

Cause

The homepage response being crawled likely lacks server-rendered head metadata, either because the SEO tags were removed/misconfigured in the template, generated only on the client side after JavaScript runs, or blocked by a caching/CDN layer serving an old/minimal version of the page. As a result, the crawler could not find the canonical URL, standard meta tags, Open Graph tags, or the JSON-LD business schema containing the phone number.

Fix

Add the missing SEO/head markup to the homepage HTML served by the origin (not only client-side after hydration): canonical tag pointing to <https://sanadihospital.in/>, meta description, keywords, robots, Open Graph title/image, and a JSON-LD `<script type='application/ld+json'>` for MedicalBusiness/Organization including phone +91-8353298899. If the site is rendered by SSR/SSG or a CMS, ensure these tags are populated in the template/layout and are present in the initial response source that crawlers fetch; then clear any CDN/cache so the updated head is served.
